

# HERBIVORES!

These two herbivores skulls look very similar, however, they actually eat different things, in different ways.

**See if you can find at least 10 differences between them.  
Can you use these differences to work out how they differ  
in their diet?**

*HINTS:*

Look at the differences between the teeth, especially crests and bumps. How do their surfaces differ? How would these differences affect how these animals feed?
