

CARNIVORES!

These two carnivore skulls look very similar, however, they actually eat different things, in different ways.

**See if you can find at least 10 differences between them.
Can you use these differences to work out how they differ
in their diet?**

HINTS:

Look for muscle attachments, i.e., large flat areas and/or ridges where big muscles might have been attached. How would these muscles affect how these animals feed?
