

# AM I BIDEPDAL?

Obviously we know that humans are **bipedal** – that is we walk around upright. We also know that chimpanzees are not bipedal – they walk around on all fours. But when we find **fossil apes** how can we tell whether they were bipedal or not, even if we only have their skulls?

**See if you can work out what feature of a human skull shows that we are bipedal.**

*HINTS:*

Think about what walking upright actually involves for the skull.
